Be informed quickly in the event of a fire
EI ELECTRONICS fire detection and MOBEYE alarm forwarding

A smoke detector is a reliable and often mandatory safety device. Its primary function is to sound a local alarm, alerting those nearby. However, adding telephone notifications to designated contacts provides a crucial extra layer of protection, potentially saving property—and even lives.
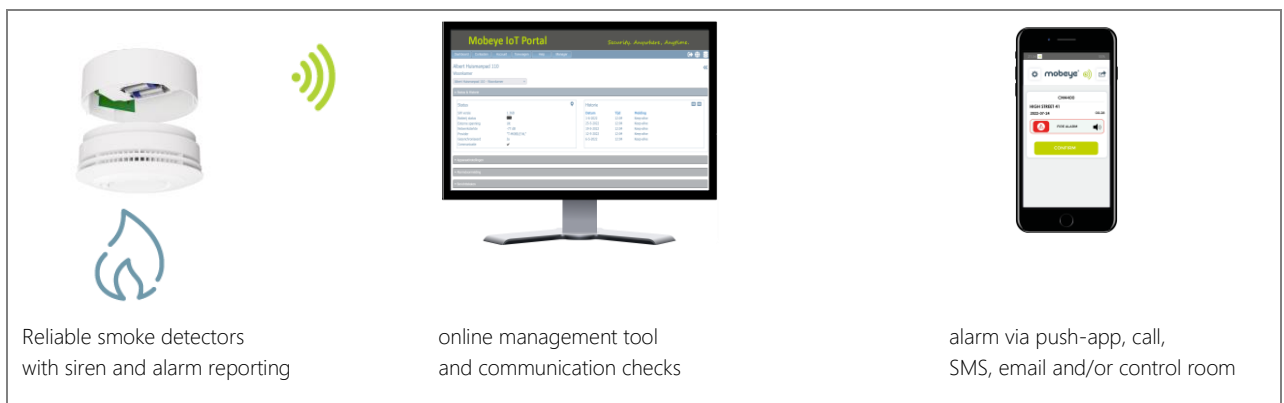

Fire alarm

For single-detector setups, the CM4400 combines an Ei Electronics optical smoke detector with the Mobeye CM4410 communication module. In the event of an alarm, notifications can be sent via push message, call, SMS, and email to your own contacts or the notification goes to a professional alarm receiving center.

Autonomous working

Both the smoke detector and the Mobeye communication module are battery-powered. The Mobeye module's battery requires replacement annually, while the smoke detector's battery lasts for its entire 10-year lifespan without needing replacement. No internet or phone line is needed at the location. The module includes an affordable SIM card for mobile network connectivity, ensuring reliable communication.

For setups requiring multiple detectors, please refer to the document titled "Mobeye - multiple fire-CO detectors with alarm notification by phone".
